

Communicable, maternal, neonatal, and nutritional diseases—Level 1 cause

Summary CMNN diseases caused 10·2 million (95% UI 9·19–11·4) deaths, 669 million (593–758) DALYs, and 104 million (77·1–137) YLDs in 2019 globally for all ages, which represented a 36·3% (29·1–42·3) decrease in deaths, a 44·4% (37·4–50·5) decrease in DALYs, and a 22·1% (18·2–26·8) increase in YLDs from 1990.

Definition This aggregate cause contains seven Level 2 causes: HIV/AIDS and sexually transmitted infections, respiratory infections and tuberculosis, enteric infections, neglected tropical diseases and malaria, other infectious diseases, maternal and neonatal disorders, and nutritional deficiencies.

Table 1: Total sources used in GBD 2019 estimation

What is new in GBD 2019?

- Where applicable, both-sex and wide-age-binned data were split before non-fatal modelling. Adjustment for alternative study methods and case definitions were applied to data before analysis in DisMod-MR 2.1.
- A systematic review found 81 new data sources for both maternal deaths and non-fatal outcomes.
- Clinical administrative data processing was revised to better account for the ratio of neonatal inpatient to outpatient visits.
- Improved redistribution of sepsis and jaundice garbage-coded deaths led to changes in cause-specific mortality assessment for neonatal disorders, especially in the post-neonatal period.
- Model-specific covariates were updated for both cause-of-death and non-fatal modelling for nutritional deficiencies.
