

1. Použijte neparametrický Spearmanův korelační koeficient pro vyjádření korelace všech dvou proměnných.
2. Testujte normalitu u jednotlivých proměnných.
3. U proměnných s normálním rozdělením testujte korelaci rovněž za použití Pearsonova parametrického korelačního koeficientu.
4. Porovnejte předešlé výsledky.
5. Pomocí metody lineární regrese odhadněte výsledky měření místo chybějících hodnot na listu **Vícerozměrná regrese**.
6. Stanovte R^2 lineární regrese, pearsonovu korelaci obou proměnných a diskutujte jejich vzájemnou závislost.
7. Na listu **Vícerozměrná regrese** spočítejte statistickou významnost prediktorů nezaměstnanosti.
8. Opakujte analýzu pouze s významnými prediktory.

vojic proměnných na listu **Korelace**.

ametrického korelačního koeficientu.

listu **Regrese**.

ájemný vztah.

losti na vzorku 30 obcí.

Pomocí metody lineární regrese a software Statistica odhadněte ze znalosti koncentrací PCB 153 a PCB 180 konstantní část a sklon regresní přímky, R^2 výsledného modelu a Pearsonův korelační koeficient r .
Existuje nějaký vztah mezi r a R^2 ?

Ověřte výsledek pomocí odpovídajících funkcí v Excelu.

Statistica

Excel

Na níže uvedeném vzorku obcí testujte (v software Statistica), zda lze nezaměstnanost (nezaměstnanost) predikovat pomocí
 počet obyvatel (obyvatel), podíl důchodců (stari), počet ekonomických subjektů (plyn), počet katastrů (katastr) a počet zahrad (zahrady).
 Z prediktorů vyberte pouze statisticky významné ($p < 0,05$) a analýzu opakujte. Výsledky uveďte v tabulce níže.

| Název prediktoru | velikost | p |
|------------------|----------|---|
