αCharges: Partial atomic charges for AlphaFold structures

- **Computes charges for AlphaFold2 structures from AlphaFoldDB**
- **Method:** SQE+qp, parameterized for (B3LYP/6-31G*/NPA)
- **Inputs:** UniProt ID of AlphaFoldDB molecules
- **Outputs:** plain text, mmCIF, PQR
- **Visualization:** Mol*
- **Web page:** https://alphacharges.ncbr.muni.cz/

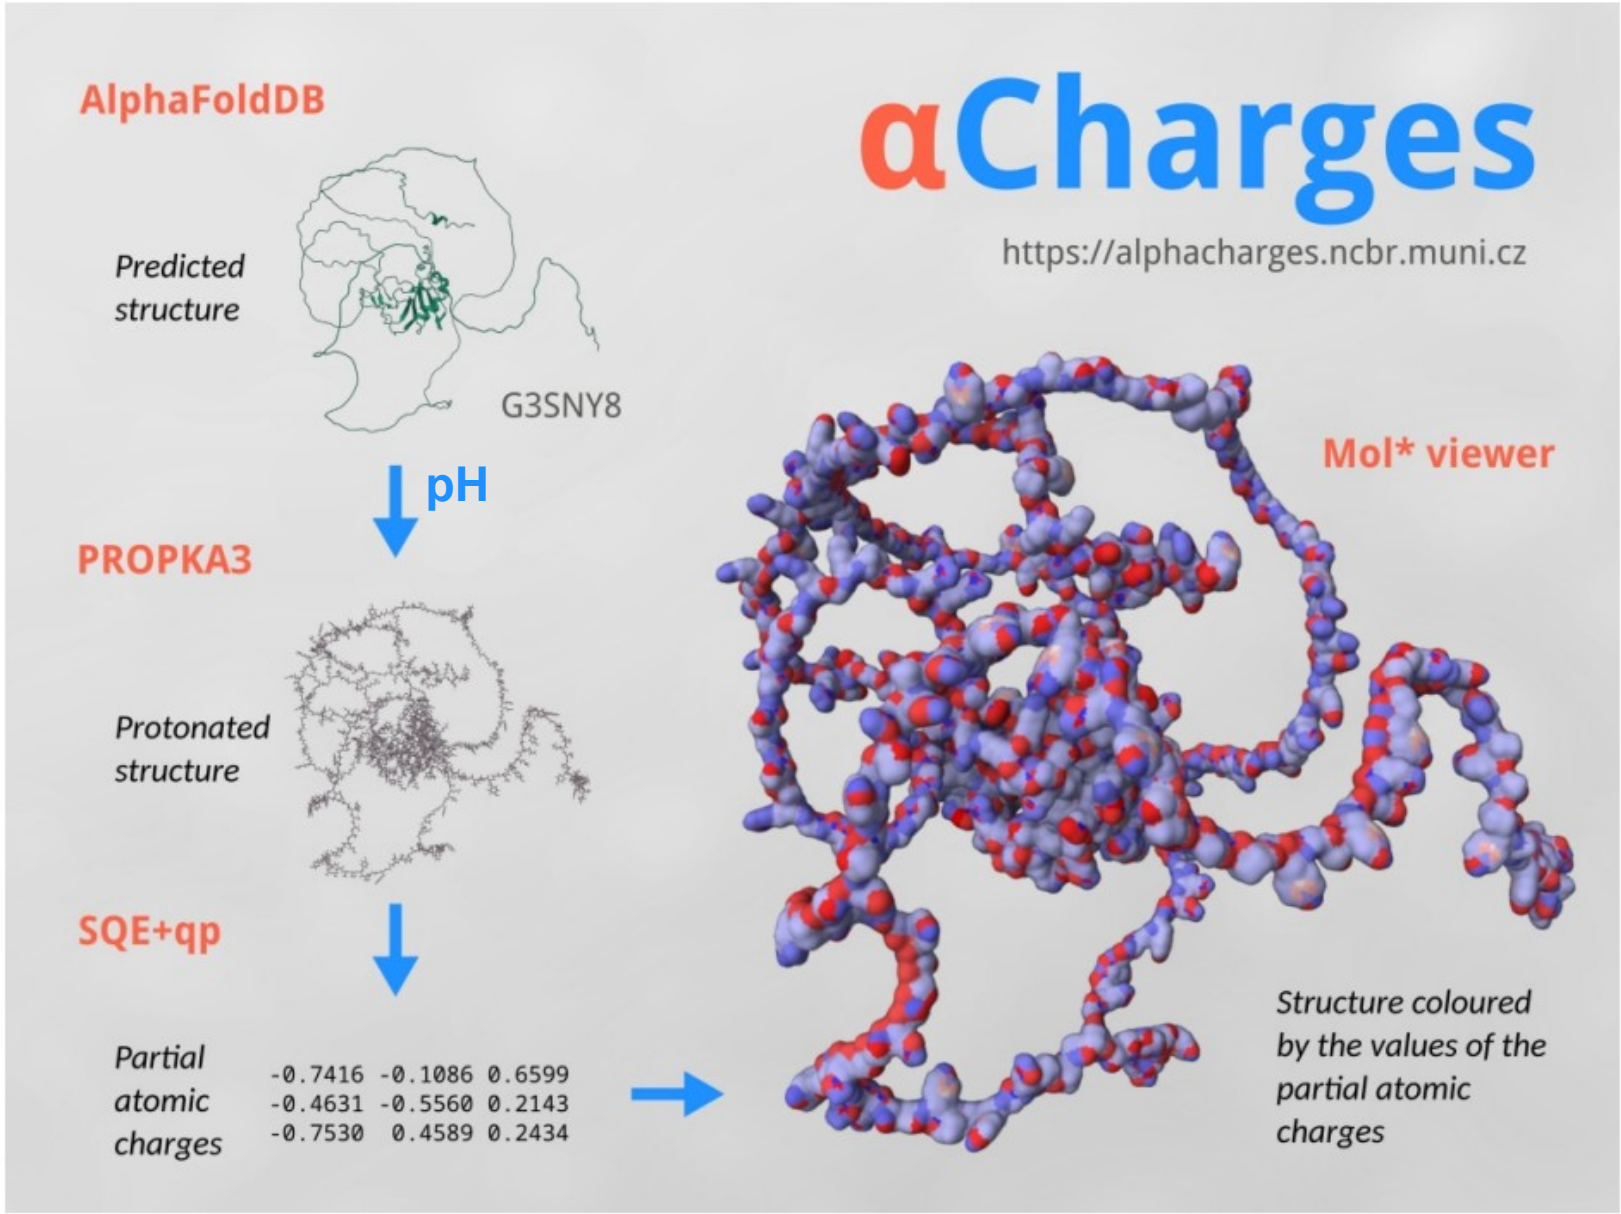
αCharges: Partial atomic charges for AlphaFold structures



αCharges

AlphaCharges (**αCharges**) is a web application for the calculation of partial atomic charges on protein structures predicted by the AlphaFold2 algorithm and deposited in the AlphaFoldDB database. The charges are computed by the SQE+qp empirical method, which quality is comparable to quantum mechanical charge calculation approaches (specifically, it is parameterized using B3LYP/6-31G*/NPA quantum mechanical charges). Before computation of the charges, **αCharges** protonates the input protein structures by PROPKA3. The details about the methodology and usage are described in the manual. This website is free and open to all users and there is no login requirement. Source codes are freely available at GitHub.

UniProt code:

e.g., P34712, L8BU87
